1 Introduction

The introduction should clearly state and give a relatively short and essential overview of the topic you are focusing on. References to definitions can be made here. The introduction should not contain the conclusions. At the end of the introduction, the outline of the paper may be described.

1.1 Course Objectives

Summarize the main goals/objectives that you accomplished this semester.

2 Bucket Sort

2.1 Description

Bucket sort is a sorting algorithm that separate the elements into multiple groups said to be buckets. Elements in bucket sort are first uniformly divided into groups called buckets, and then they are sorted by any other sorting algorithm. After that, elements are gathered in a sorted manner.

2.2 Algorithm

Algorithm 1 Bucket Sort

```
1: procedure BUCKETSORT(A)
       Let B[0...n-1] be a new array
       n = \text{length of } A
 3:
 4:
       for i \leftarrow 0 to n-1 do
 5:
           make B[i] an empty list
       end for
 6:
       for i \leftarrow 1 to n do
 7:
           insert A[i] into list B[na[i]]
 8:
       end for
9:
       for i \leftarrow 0 to n-1 do
10:
           sort list B[i] with insertion-sort
11:
       end for
12:
       Concatenate lists B[0], B[1], \dots, B[n-1] together in order
13:
14: end procedure
```

```
#include <iostream>
     #include <vector>
2
     using namespace std;
3
4
     void bucketSort(float arr[], int n) {
5
         // Create n empty buckets
6
         vector<float> b[n];
7
8
         // Put array elements in different buckets
9
         for (int i = 0; i < n; i++) {
10
             int bi = n * arr[i]; // Index in bucket
11
             b[bi].push_back(arr[i]);
12
         }
13
14
         // Sort individual buckets
15
         for (int i = 0; i < n; i++)
16
             sort(b[i].begin(), b[i].end());
17
18
         // Concatenate all buckets into arr[]
19
         int index = 0;
20
         for (int i = 0; i < n; i++)
21
             for (int j = 0; j < b[i].size(); j++)</pre>
22
                  arr[index++] = b[i][j];
23
25
     // * Driver program to test above functions
26
     int main() {
27
         int n;
28
```

```
cout << "Enter the number of elements: ";</pre>
29
          cin >> n;
30
          float arr[n];
31
          cout << "Enter the elements: ";</pre>
32
          for (int i = 0; i < n; i++)
33
              cin >> arr[i];
34
          bucketSort(arr, n);
35
36
          cout << "Sorted array is ";</pre>
37
          for (int i = 0; i < n; i++)
38
              cout << arr[i] << " ";
39
          return 0;
40
41
```

```
Enter the number of elements: 5
Enter the elements: 0.897 0.565 0.656 0.1234 0.665
Sorted array is 0.1234 0.565 0.656 0.665 0.897
```

3 Kruskal's Algorithm

3.1 Description

Kruskal's algorithm is a minimum spanning tree algorithm that finds an edge of the least possible weight that connects any two trees in the forest. It is a greedy algorithm in graph theory as it finds a minimum spanning tree for a connected weighted graph adding increasing cost arcs at each step.

3.2 Algorithm

Algorithm 2 Kruskal's Algorithm

```
1: procedure KRUSKAL(G)
 2:
       A \leftarrow \emptyset
       for each vertex v \in V[G] do
3:
           MAKE - SET(v)
 4:
       end for
 5:
       Sort the edges of E[G] into nondecreasing order by weight w
 6:
       for each edge (u, v) \in E[G], taken in nondecreasing order by weight do
 7:
           if FIND - SET(u) \neq FIND - SET(v) then
 8:
              A \leftarrow A \cup \{(u, v)\}
9:
              UNION(u, v)
10:
           end if
11:
12:
       end for
13:
       returnA
14: end procedure
```

```
#include <iostream>
1
     #include <vector>
2
3
     // data structure to store graph edges
4
    struct Edge {
5
         int src, dest, weight;

4 Bucket Sort

4.1 Description

Bucket sort is a sorting algorithm that separate the elements into multiple groups said to be buckets. Elements in bucket sort are first uniformly divided into groups called buckets, and then they are sorted by any other sorting algorithm. After that, elements are gathered in a sorted manner.

4.2 Algorithm

Algorithm 3 Bucket Sort

```
1: procedure BucketSort(A)
       Let B[0...n-1] be a new array
       n = \text{length of } A
 3:
 4:
       for i \leftarrow 0 to n-1 do
 5:
           make B[i] an empty list
       end for
 6:
       for i \leftarrow 1 to n do
 7:
           insert A[i] into list B[na[i]]
 8:
       end for
9:
       for i \leftarrow 0 to n-1 do
10:
           sort list B[i] with insertion-sort
11:
       end for
12:
       Concatenate lists B[0], B[1], \dots, B[n-1] together in order
13:
14: end procedure
```

```
#include <iostream>
     #include <vector>
2
     using namespace std;
3
4
     void bucketSort(float arr[], int n) {
5
         // Create n empty buckets
6
         vector<float> b[n];
7
8
         // Put array elements in different buckets
9
         for (int i = 0; i < n; i++) {
10
             int bi = n * arr[i]; // Index in bucket
11
             b[bi].push_back(arr[i]);
12
         }
13
14
         // Sort individual buckets
15
         for (int i = 0; i < n; i++)
16
             sort(b[i].begin(), b[i].end());
17
18
         // Concatenate all buckets into arr[]
19
         int index = 0;
20
         for (int i = 0; i < n; i++)
21
             for (int j = 0; j < b[i].size(); j++)</pre>
22
                  arr[index++] = b[i][j];
23
25
     // * Driver program to test above functions
26
     int main() {
27
         int n;
28
```

```
cout << "Enter the number of elements: ";</pre>
29
30
          cin >> n;

          cout << "Enter the elements: ";</pre>
32
          for (int i = 0; i < n; i++)
33
              cin >> arr[i];
34
          bucketSort(arr, n);
35
36
          cout << "Sorted array is ";</pre>
37
          for (int i = 0; i < n; i++)
38
              cout << arr[i] << " ";
39
          return 0;
40
41
```

```
Enter the number of elements: 5
Enter the elements: 0.897 0.565 0.656 0.1234 0.665
Sorted array is 0.1234 0.565 0.656 0.665 0.897
```

5 Quick Sort

5.1 Description

Quicksort picks an element as pivot, and then it partitions the given array around the picked pivot element. In quick sort, a large array is divided into two arrays in which one holds values that are smaller than the specified value (Pivot), and another array holds the values that are greater than the pivot. After that, left and right sub-arrays are also partitioned using the same approach. It will continue until the single element remains in the sub-array.

5.2 Algorithm

```
Algorithm 4 Quick Sort
```

```
1: procedure QUICKSORT(array, left, right)
2: if left < right then
3: pivot = partition(array, left, right)
4: QuickSort(array, left, pivot - 1)
5: QuickSort(array, pivot + 1, right)
6: end if
7: end procedure
```

```
#include <iostream>
1
     using namespace std;
2
3
     /* This function takes last element as pivot, places
     the pivot element at its correct position in sorted
5
     array, and places all smaller (smaller than pivot)
6
     to left of pivot and all greater elements to right
7
     of pivot */
8
9
10
     int partition (int arr[], int low, int high)
11
         int pivot = arr[high]; // pivot
12
         int i = (low - 1); // Index of smaller element
13
14
         for (int j = low; j \le high - 1; j++) {
15
             // If current element is smaller than or
16
             // equal to pivot
17
             if (arr[j] <= pivot) {</pre>
18
                  i++; // increment index of smaller element
19
                  swap(&arr[i], &arr[j]);
20
             }
21
         }
22
23
         swap(&arr[i + 1], &arr[high]);
         return (i + 1);
24
25
26
     // The main function that implements QuickSort
27
     // arr[] --> Array to be sorted,
28
     // low --> Starting index,
29
     // high --> Ending index
30
31
     void quickSort(int arr[], int low, int high)
32
     {
33
         if (low < high) {
34
             /* pi is partitioning index, arr[p] is now
35
             at right place */
36
             int pi = partition(arr, low, high);
37
38
             // Separately sort elements before
39
             // partition and after partition
40
             quickSort(arr, low, pi - 1);
41
             quickSort(arr, pi + 1, high);
42
         }
43
44
45
     // Function to print an array
46
     void printArray(int arr[], int size)
47
48
         for (int i = 0; i < size; i++)
49
             cout << arr[i] << " ";
50
         cout << endl;</pre>
51
52
    }
```

```
53
     int main()
54
55
          int arr[] = { 10, 7, 8, 9, 1, 5 };
56
          int n = sizeof(arr) / sizeof(arr[0]);
57
          quickSort(arr, 0, n - 1);
58
          cout << "Sorted array: n";</pre>
59
          printArray(arr, n);
60
         return 0;
61
62
```

```
Enter the number of elements: 5
Enter the elements: 170 45 75 90 802
Sorted array is 45 75 90 170 802
```

6 Merge Sort

6.1 Description

Merge sort is similar to the quick sort algorithm as it uses the divide and conquer approach to sort the elements. It is one of the most popular and efficient sorting algorithm. It divides the given list into two equal halves, calls itself for the two halves and then merges the two sorted halves. We have to define the merge() function to perform the merging.

The sub-lists are divided again and again into halves until the list cannot be divided further. Then we combine the pair of one element lists into two-element lists, sorting them in the process. The sorted two-element pairs is merged into the four-element lists, and so on until we get the sorted list.

6.2 Algorithm

```
Algorithm 5 Merge Sort
```

```
1: procedure MERGESORT(array, left, right)
2: if left < right then
3: middle = (left + right)/2
4: MergeSort(array, left, middle)
5: MergeSort(array, middle + 1, right)
6: merge(array, left, middle, right)
7: end if
8: end procedure
```

```
#include <iostream>
1
     using namespace std;
2
3
     // merge two sorted subarrays arr[low..mid] and arr[mid+1..high]
     void merge(int arr[], int low, int mid, int high)
5
6
         // create a temp array
7
         int temp[high - low + 1];
8
9
         // crawlers for both intervals and for temp
10
         int i = low, j = mid + 1, k = 0;
11
12
         // traverse both arrays and in each iteration add smaller of both elements in temp
13
         while (i \leq mid && j \leq high)
14
         {
             if (arr[i] <= arr[j])</pre>
16
                  temp[k++] = arr[i++];
             else
18
                  temp[k++] = arr[j++];
19
         }
20
         // add elements left in the first interval
22
         while (i <= mid)
23
             temp[k++] = arr[i++];
24
25
         // add elements left in the second interval
26
         while (j <= high)
27
             temp[k++] = arr[j++];
29
         // copy temp to original interval
30
         for (int i = low; i <= high; i++)
31
             arr[i] = temp[i - low];
32
     }
33
34
     // Recursive implementation of merge sort
35
     void mergeSort(int arr[], int low, int high)
36
37
         // base condition
38
         if (low == high)
39
40
             return;
41
         // find the mid value
42
         int mid = (low + (high - low) / 2);
43
44

```

7 Heap Sort

7.1 Description

Heap sort processes the elements by creating the min-heap or max-heap using the elements of the given array. Min-heap or max-heap represents the ordering of array in which the root element represents the minimum or maximum element of the array.

7.2 Algorithm

```
Algorithm 6 Heap Sort
```

```
    procedure HEAPSORT(array, n)
    buildMaxHeap(array, n)
    for i ← n to 1 do
    swap array[0] and array[i]
    heapify(array, i, 0)
    end for
    end procedure
```

```
#include <iostream>
using namespace std;

// Function to heapify the tree
void heapify(int arr[], int n, int i)
{
```

```
int largest = i; // Initialize largest as root
7
         int l = 2 * i + 1; // left = 2*i + 1
         int r = 2 * i + 2; // right = 2*i + 2
9
10
         // If left child is larger than root
11
         if (1 < n && arr[1] > arr[largest])
12
              largest = 1;
13
         // If right child is larger than largest so far
15
         if (r < n && arr[r] > arr[largest])
16
              largest = r;
17
18
         // If largest is not root
19
         if (largest != i) {
20
              swap(&arr[i], &arr[largest]);
21
              // Recursively heapify the affected sub-tree
22
              heapify(arr, n, largest);
23
         }
24
25
26
     // Function to build a Max-Heap from the given array
27
     void buildHeap(int arr[], int n)
28
29
         // Index of last non-leaf node
30
         int startIdx = (n / 2) - 1;
31
32
         // Perform reverse level order traversal from last non-leaf node and heapify each
33
     \hookrightarrow node
         for (int i = startIdx; i >= 0; i--) {
34
              heapify(arr, n, i);
35
36
         }
     }
37
38

```

8 Depth First Search

8.1 Description

The depth-first search (DFS) algorithm starts with the initial node of graph G and goes deeper until we find the goal node or the node with no children.

8.2 Algorithm

Algorithm 7 Depth First Search

```
1: procedure DFS(G, v)
2: mark v as visited
3: for each unvisited neighbor w of v do
4: DFS(G, w)
5: end for
6: end procedure
```

```
#include <iostream>
1
     #include <vector>
2
     #include <stack>
3
     using namespace std;
4
5
     struct Edge {
6
7
         int src, dest;
    };
8
9
10
     class Graph
11
    public:
12
         vector<vector<int>>> adjList;
13
14
         Graph(vector<Edge> const &edges, int N)
15
16
             // resize the vector to N elements of type vector<int>
             adjList.resize(N);
18
19
             // add edges to the directed graph
20
             for (auto &edge: edges)
21
             {
22
                  // insert at the end
23
                  adjList[edge.src].push_back(edge.dest);
24
                  // Uncomment below line for undirected graph
25
                  // adjList[edge.dest].push_back(edge.src);
26
27
         }
28
    };
29

9 Breadth First Search

9.1 Description

Breadth-first search is a graph traversal algorithm that starts traversing the graph from the root node and explores all the neighbouring nodes. Then, it selects the nearest node and explores all the unexplored nodes.

9.2 Algorithm

Algorithm 8 Breadth First Search

```
1: procedure BFS(G, s)
 2:
         for each vertex u \in V[G] do
             d[u] \leftarrow \infty
 3:
             \pi[u] \leftarrow NIL
 4:
         end for
 5:
         d[s] \leftarrow 0
 6:
         Q \leftarrow \emptyset
 7:
         \text{ENQUEUE}(Q, s)
 8:
         while Q \neq \emptyset do
 9:
10:
             u \leftarrow DEQUEUE(Q)
             for each vertex v \in Adj[u] do
11:
                 if d[v] = \infty then
12:
                      d[v] \leftarrow d[u] + 1
13:
                      \pi[v] \leftarrow u
14:
                      \text{ENQUEUE}(Q, v)
15:
16:
                 end if
             end for
17:
         end while
18:
19: end procedure

10 Prim's Algorithm

10.1 Description

Prim's algorithm is a greedy algorithm that finds a minimum spanning tree for a weighted undirected graph. This means it finds a subset of the edges that forms a tree that includes every vertex, where the total weight of all the edges in the tree is minimized. The algorithm operates by building this tree one vertex at a time, from an arbitrary starting vertex, at each step adding the cheapest possible connection from the tree to another vertex.

10.2 Algorithm

Algorithm 9 Prim's Algorithm

```
1: procedure PRIM(G)
        for each vertex u \in V[G] do
 3:
             key[u] \leftarrow \infty
            \pi[u] \leftarrow NIL
 4:
        end for
 5:
        key[s] \leftarrow 0
 6:
        Q \leftarrow V[G]
 7:
        while Q \neq \emptyset do
 8:
            u \leftarrow EXTRACT - MIN(Q)
9:
            for each vertex v \in Adj[u] do
10:
                if v \in Q and w(u, v) < key[v] then
11:
                     \pi[v] \leftarrow u
12:
                     key[v] \leftarrow w(u, v)
13:
14:
                end if
            end for
15:
16:
        end while
17: end procedure
```

0 - 4

4 - 5

2 - 1

1 - 2

3 - 2

Weight of the MST is 16
```

11 Kruskal's Algorithm

11.1 Description

Kruskal's algorithm is a minimum spanning tree algorithm that finds an edge of the least possible weight that connects any two trees in the forest. It is a greedy algorithm in graph theory as it finds a minimum spanning tree for a connected weighted graph adding increasing cost arcs at each step.

11.2 Algorithm

Algorithm 10 Kruskal's Algorithm

```
1: procedure KRUSKAL(G)
2:
       A \leftarrow \emptyset
 3:
       for each vertex v \in V[G] do
           MAKE - SET(v)
 4:
       end for
 5:
       Sort the edges of E[G] into nondecreasing order by weight w
 6:
       for each edge (u, v) \in E[G], taken in nondecreasing order by weight do
 7:
           if FIND - SET(u) \neq FIND - SET(v) then
 8:
9:
               A \leftarrow A \cup \{(u,v)\}
              UNION(u, v)
10:
           end if
11:
       end for
12:
       returnA
13:
14: end procedure
```

```
